

EMUNE

GENERAL INFORMATION:

EMUNE is a biologically fermented extract that will kill juvenile nematodes and cysts that attack root systems. *EMUNE* works by suffocating nematode eggs and j2 stage juvenile nematodes.

EMUNE

works as a soil conditioner, containing nutrients that stimulate beneficial soil biology, helping them to grow and out compete pathogens

can be sprayed on the soil surface with 15-20 gallons of water/liquid. Allow rain or irrigation water to take into the soil, for a more targeted approach spray in a band directly above the plant roots

Application:

EMUNE works in the soil, at the root zone of the plant.

Apply 1-2 gallons per acre of *EMUNE* depending on the severity of the nematode infection

Apply *EMUNE* in furrow during planting, as it will not affect germination or side-dress with fertilizer
